Block numbers, 321-avoidance and Schur-positivity

Eli Bagno (Jerusalem College of Technology)
joint work with Ron M. Adin and Yuval Roichman

Permutation Patterns 2017

Short description of results

We present here three results concerning the block number statistic on 321-avoiding permutations:

- Equi-distribution of block number and the complement of last descent over certain sets of 321-avoiding permutations.
- The set of 321-avoiding permutations with a given block number is symmetric and Schur-positive.
- An explicit formula for the corresponding character.

Outline

1. Introduction
2. Equi-distribution
3. Symmetry and Schur-positivity
4. Proof idea
5. Open problems

Introduction

4/38

Describing pattern-avoiding classes

Let $S_n(\Pi)$ be the set of permutations in S_n avoiding a given set of patterns Π. There are several ways to provide information about this set.

1. Compute the cardinality $|\mathcal{S}_n(\Pi)|$ (Simion, Wilf, ...).
2. Compute the generating function for a statistic *stat*:

$$\sum_{\pi \in \mathcal{S}_n(\Pi)} q^{stat(\pi)}$$

(Sagan, Pak, Elizalde,...).

3. Compute the quasi-symmetric function

$$\sum_{\pi \in \mathcal{S}_n(\Pi)} F_\pi(x_1, x_2, \ldots)$$

(Sagan, Woo, ...).

Describing pattern-avoiding classes

Let $S_n(\Pi)$ be the set of permutations in S_n avoiding a given set of patterns Π. There are several ways to provide information about this set.

1. Compute the cardinality $|\mathcal{S}_n(\Pi)|$ (Simion, Wilf, ...).
2. Compute the generating function for a statistic *stat*:

$$\sum_{\pi \in \mathcal{S}_n(\Pi)} q^{stat(\pi)}$$

   (Sagan, Pak, Elizalde,...).
3. Compute the quasi-symmetric function

$$\sum_{\pi \in \mathcal{S}_n(\Pi)} F_\pi(x_1, x_2, \ldots)$$

   (Sagan, Woo, ...).

Describing pattern-avoiding classes

$$\sum_{\pi \in \mathcal{S}_n(\Pi)} q^{stat(\pi)}$$

   (Sagan, Pak, Elizalde,...).
3. Compute the quasi-symmetric function

$$\sum_{\pi \in \mathcal{S}_n(\Pi)} F_\pi(x_1, x_2, \ldots)$$

   (Sagan, Woo, ...).

Quasi-symmetric functions

Quasi-symmetric functions were defined by Gessel ('84).

Every subset $J \subseteq [n-1]$ has an associated fundamental quasi-symmetric function $F_J(\mathbf{x})$ (to be defined later).

For a set of permutations $A \subseteq \mathcal{S}_n$ define

$$\mathcal{Q}(A) = \sum_{\pi \in A} F_{\mathrm{Des}(\pi)}.$$

Symmetry and Schur-positivity

Question (Gessel and Reutenauer, '93)

For which $A \subseteq \mathcal{S}_n$ is $\mathcal{Q}(A)$ a symmetric function?

A symmetric function is Schur-positive if all the coefficients in its expression as a linear combination of Schur functions are non-negative.
Call $A \subseteq \mathcal{S}_n$ Schur-positive if $\mathcal{Q}(A)$ is.

For example,

Theorem (Gessel and Reutenauer, '93)

Conjugacy classes are symmetric and Schur-positive.

Symmetry and Schur-positivity

Question (Gessel and Reutenauer, '93)

For which $A \subseteq \mathcal{S}_n$ is $\mathcal{Q}(A)$ a symmetric function?

A symmetric function is Schur-positive if all the coefficients in its expression as a linear combination of Schur functions are non-negative.
Call $A \subseteq \mathcal{S}_n$ Schur-positive if $\mathcal{Q}(A)$ is.

For example,

Theorem (Gessel and Reutenauer, '93)

Conjugacy classes are symmetric and Schur-positive.

Symmetry and Schur-positivity

Question (Gessel and Reutenauer, '93)

For which $A \subseteq \mathcal{S}_n$ is $\mathcal{Q}(A)$ a symmetric function?

A symmetric function is Schur-positive if all the coefficients in its expression as a linear combination of Schur functions are non-negative.
Call $A \subseteq \mathcal{S}_n$ Schur-positive if $\mathcal{Q}(A)$ is.

For example,

Theorem (Gessel and Reutenauer, '93)

Conjugacy classes are symmetric and Schur-positive.

Symmetry and Schur-positivity

Classical examples of (symmetric and) Schur-positive sets of permutations include:

- Conjugacy classes
- Inverse descent classes
- Knuth classes
- Permutations with a fixed inversion number
- Arc permutations

Problem (Sagan and Woo, '14)

Find sets of patterns Π *and parameters stat such that* $\mathcal{Q}(\{\sigma \in \mathcal{S}_n(\Pi) \mid stat(\sigma) = k\})$ *is symmetric and Schur-positive.*

Symmetry and Schur-positivity

Classical examples of (symmetric and) Schur-positive sets of permutations include:

- Conjugacy classes
- Inverse descent classes
- Knuth classes
- Permutations with a fixed inversion number
- Arc permutations

Problem (Sagan and Woo, '14)

Find sets of patterns Π *and parameters stat such that* $\mathcal{Q}(\{\sigma \in \mathcal{S}_n(\Pi) \mid stat(\sigma) = k\})$ *is symmetric and Schur-positive.*

Equi-distribution

Direct sum of permutations

Definition

Let $\pi \in \mathcal{S}_m$ and $\sigma \in \mathcal{S}_n$. The direct sum of π and σ is the permutation $\pi \oplus \sigma \in \mathcal{S}_{m+n}$ defined by

$$(\pi \oplus \sigma)_i = \begin{cases} \pi(i), & \text{if } i \leq n; \\ \sigma(i-n)+n, & \text{otherwise.} \end{cases}$$

Example

If $\pi = 132$ and $\sigma = 4231$ then $\pi \oplus \sigma = 1327564$.

The direct sum is clearly associative.

Block number

Definition

A nonempty permutation which is not a direct sum of two nonempty permutations is called $\oplus$-irreducible.
Each permutation π can be written uniquely as a direct sum of $\oplus$-irreducible ones, called the blocks of π. Their number $\mathrm{bl}(\pi)$ is the block number of π.

Example

$$\mathrm{bl}(45321) = 1,$$

$$\mathrm{bl}(312 \mid 54) = 2,$$

$$\mathrm{bl}(1 \mid 2 \mid 3 \mid 4) = 4.$$

Remarks

- Direct sums and block decomposition of permutations appear naturally in the study of pattern-avoiding classes (Albert, Atkinson, Vatter).
- The block number of an arbitrary permutation was previously studied by Richard Stanley (2005), as the cardinality of the connectivity set (defined by Comtet).

Last descent

Definition

For a permutation $\pi \in \mathcal{S}_n$ *let*

$$\mathrm{ldes}(\pi) := \max\{i : \ i \in \mathrm{Des}(\pi)\},$$

with $\mathrm{ldes}(\pi) := 0$ *if* $\mathrm{Des}(\pi) = \emptyset$ *(i.e., if* π *is the identity permutation).*

Example

$$\mathrm{ldes}(3176245) = 4$$

The sets $Bl_{n,k}$ and $L_{n,k}$

Definition

Let

$$Bl_{n,k} := \{\pi \in \mathcal{S}_n(321) : \ \mathrm{bl}(\pi) = k\}.$$

Note that $\mathrm{bl}(\pi) = \mathrm{bl}(\pi^{-1})$.

Definition

Let

$$L_{n,k} = \{\pi \in \mathcal{S}_n(321) : \ \mathrm{ldes}(\pi^{-1}) = k\}.$$

Cardinality

Definition

Recall: The n-th Catalan number is

$$C_n = \frac{1}{n+1}\binom{2n}{n}.$$

The corresponding generating function is

$$c(x) = \sum_{n=0}^{\infty} C_n x^n = \frac{1-\sqrt{1-4x}}{2x}.$$

Cardinality

Definition

For each $k \geq 0$, the n-th k-fold Catalan number is the coefficient of x^n in $(xc(x))^k$. Explicitly:

$$C_{n,k} = \frac{k}{2n-k}\binom{2n-k}{n}.$$

Proposition

For positive integers $n \geq k \geq 1$:

$$C_{n,k} = |SYT(n-1, n-k)| = |L_{n,n-k}| = |B_{n,k}|$$

This result will be refined in the sequel.

Left-to-right maxima

Definition

The set of left-to-right maxima of $\pi \in \mathcal{S}_n$ *is*

$$\text{ltrMax}(\pi) = \{i \mid \pi(i) > \pi(j) \textit{ for all } i < j\}$$

Example

$$\pi = \bar{3}12\bar{5}4\bar{6}.$$

Observation

For 321-avoiding permutations, the set of left-to-right maxima determines the descent set. Explicitly, for any $1 \le i \le n-1$,

$$i \in \text{Des}(\pi) \iff i \in \text{ltrMax}(\pi) \textit{ and } i+1 \notin \text{ltrMax}(\pi).$$

Left-to-right maxima

Definition

The set of left-to-right maxima of $\pi \in \mathcal{S}_n$ *is*

$$\mathrm{ltrMax}(\pi) = \{i \mid \pi(i) > \pi(j) \text{ for all } i < j\}$$

Example

$$\pi = \bar{3}12\bar{5}4\bar{6}.$$

Observation

For 321-avoiding permutations, the set of left-to-right maxima determines the descent set. Explicitly, for any $1 \leq i \leq n-1$,

$$i \in \mathrm{Des}(\pi) \iff i \in \mathrm{ltrMax}(\pi) \text{ and } i+1 \notin \mathrm{ltrMax}(\pi).$$

Main result 1: Equi-distribution

Theorem (Adin-B.-Roichman '16)

For every positive integer n,

$$\sum_{\pi\in\mathcal{S}_n(321)} \mathbf{x}^{\mathrm{ltrMax}(\pi^{-1})} q^{\mathrm{bl}(\pi)} = \sum_{\pi\in\mathcal{S}_n(321)} \mathbf{x}^{\mathrm{ltrMax}(\pi^{-1})} q^{n-\mathrm{ldes}(\pi)}.$$

Note the analogy with the classical

Theorem (Foata-Schützenberger '70)

For every positive integer n,

$$\sum_{\pi\in\mathcal{S}_n} \mathbf{x}^{\mathrm{Des}(\pi^{-1})} q^{\mathrm{inv}(\pi)} = \sum_{\pi\in\mathcal{S}_n} \mathbf{x}^{\mathrm{Des}(\pi^{-1})} q^{\mathrm{maj}(\pi)}.$$

Main result 1: Equi-distribution

Theorem (Adin-B.-Roichman '16)

For every positive integer n,

$$\sum_{\pi\in\mathcal{S}_n(321)} \mathbf{x}^{\mathrm{ltrMax}(\pi^{-1})} q^{\mathrm{bl}(\pi)} = \sum_{\pi\in\mathcal{S}_n(321)} \mathbf{x}^{\mathrm{ltrMax}(\pi^{-1})} q^{n-\mathrm{ldes}(\pi)}.$$

Note the analogy with the classical

Theorem (Foata-Schützenberger '70)

For every positive integer n,

$$\sum_{\pi\in\mathcal{S}_n} \mathbf{x}^{\mathrm{Des}(\pi^{-1})} q^{\mathrm{inv}(\pi)} = \sum_{\pi\in\mathcal{S}_n} \mathbf{x}^{\mathrm{Des}(\pi^{-1})} q^{\mathrm{maj}(\pi)}.$$

Symmetry and Schur-positivity

Symmetric functions

Definition

A symmetric function is a formal power series $f \in \mathbb{C}[[x_1, x_2, \cdots]]$ *which is invariant under any permutation of the variables.*

- We sometimes restrict to a finite number of variables by setting almost all of them to zero.

Example

$f = x_1 + x_2 + x_3$ is symmetric and homogeneous of degree 1. (with $x_4 = x_5 = \ldots = 0$).

Semistandard tableaux

Definition

Let λ be a partition. A semistandard Young tableau of shape λ is a filling of the cells of λ by positive integers such that

- The entries in each row are weakly increasing.
- The entries in each column are strictly increasing.

Example

$$\lambda = (4, 3, 2) \qquad T = \begin{array}{|c|c|c|c|}\hline 1 & 2 & 2 & 3 \\ \hline 3 & 3 & 4 \\ \cline{1-3} 5 & 6 \\ \cline{1-2}\end{array}$$

Schur functions

With each semistandard Young tableau T we associate a monomial

$$\mathbf{x}^T = \prod_i x_i^{\text{number of i's in} \, T}.$$

Example

$$T = \begin{array}{|c|c|c|c|} \hline 1 & 2 & 2 & 3 \\ \hline 3 & 3 & 4 \\ \cline{1-3} 5 & 6 \\ \cline{1-2} \end{array} \qquad \mathbf{x}^T = x_1 x_2^2 x_3^3 x_4 x_5 x_6.$$

The Schur function s_λ associated with a partition λ is defined by

$$s_\lambda = \sum_{T \in SSYT(\lambda)} \mathbf{x}^T.$$

Schur functions

Example

For $\lambda = (2,1)$, the semistandard tableaux of shape λ filled with numbers out of $\{1,2,3\}$ are

$$\begin{array}{|c|c|}\hline 1&1\\\hline 2\\\cline{1-1}\end{array},\ \begin{array}{|c|c|}\hline 1&1\\\hline 3\\\cline{1-1}\end{array},\ \begin{array}{|c|c|}\hline 1&2\\\hline 2\\\cline{1-1}\end{array},\ \begin{array}{|c|c|}\hline 1&2\\\hline 3\\\cline{1-1}\end{array},\ \begin{array}{|c|c|}\hline 1&3\\\hline 2\\\cline{1-1}\end{array},\ \begin{array}{|c|c|}\hline 1&3\\\hline 3\\\cline{1-1}\end{array},\ \begin{array}{|c|c|}\hline 2&2\\\hline 3\\\cline{1-1}\end{array},\ \begin{array}{|c|c|}\hline 2&3\\\hline 3\\\cline{1-1}\end{array}.$$

The corresponding Schur polynomial is

$$s_{(2,1)}(x_1,x_2,x_3) = x_1^2x_2 + x_1^2x_3 + x_1x_2^2 + 2x_1x_2x_3 + x_1x_3^2 + x_2^2x_3 + x_2x_3^2$$

Proposition

$\{s_\lambda \mid \lambda \vdash n\}$ is a basis for the vector space of symmetric functions which are homogeneous of degree n.

Schur functions

Example

For $\lambda = (2,1)$, the semistandard tableaux of shape λ filled with numbers out of $\{1,2,3\}$ are

$$\begin{array}{|c|c|}\hline 1 & 1 \\ \hline 2 \\ \cline{1-1}\end{array}\,,\ \begin{array}{|c|c|}\hline 1 & 1 \\ \hline 3 \\ \cline{1-1}\end{array}\,,\ \begin{array}{|c|c|}\hline 1 & 2 \\ \hline 2 \\ \cline{1-1}\end{array}\,,\ \begin{array}{|c|c|}\hline 1 & 2 \\ \hline 3 \\ \cline{1-1}\end{array}\,,\ \begin{array}{|c|c|}\hline 1 & 3 \\ \hline 2 \\ \cline{1-1}\end{array}\,,\ \begin{array}{|c|c|}\hline 1 & 3 \\ \hline 3 \\ \cline{1-1}\end{array}\,,\ \begin{array}{|c|c|}\hline 2 & 2 \\ \hline 3 \\ \cline{1-1}\end{array}\,,\ \begin{array}{|c|c|}\hline 2 & 3 \\ \hline 3 \\ \cline{1-1}\end{array}\,.$$

The corresponding Schur polynomial is

$$s_{(2,1)}(x_1, x_2, x_3) = x_1^2 x_2 + x_1^2 x_3 + x_1 x_2^2 + 2x_1 x_2 x_3 + x_1 x_3^2 + x_2^2 x_3 + x_2 x_3^2$$

Proposition

$\{s_\lambda \mid \lambda \vdash n\}$ *is a basis for the vector space of symmetric functions which are homogeneous of degree* n.

Schur-positivity

Definition

A symmetric function is called Schur-positive if all the coefficients in its expansion in the basis of Schur functions are non-negative.

Example

For $\lambda \vdash k$ and $\mu \vdash \ell$, consider the product

$$s_\lambda s_\mu = \sum_\nu c^\nu_{\lambda,\mu} s_\nu .$$

The Littlewood-Richardson rule provides a combinatorial interpretation of the coefficients $c^\nu_{\lambda,\mu}$, proving that $s_\lambda s_\mu$ is Schur-positive.

An equivalent definition of symmetric functions

A formal power series $f(x_1, x_2, \ldots)$ is symmetric if for every composition $\alpha = (\alpha_1, \ldots, \alpha_n)$, all monomials $x_{i_1}^{\alpha_1} \cdots x_{i_k}^{\alpha_k}$ in f with distinct indices have the same coefficient.

Example

$$f = \sum_{i \neq j} x_i^3 x_j = x_1^3 x_2 + x_1 x_2^3 + x_1^3 x_3 + x_1 x_3^3 + x_2^3 x_3 + x_2 x_3^3 + \ldots$$

Quasi-symmetric functions

A formal power series $f(x_1, x_2, \ldots)$ is quasi-symmetric if for every composition $(\alpha_1, \cdots, \alpha_k)$, all monomials $x_{i_1}^{\alpha_1} \cdots x_{i_k}^{\alpha_k}$ in f with indices $i_1 < i_2 < \cdots < i_k$ have the same coefficients.

Example

$$f = \sum_{i<j} x_i^2 x_j = x_1^2 x_2 + x_1^2 x_3 + x_2^2 x_3 + \ldots$$

is quasi-symmetric but not symmetric.

Denote by $QSym$ the vector space of quasi-symmetric functions which are homogeneous of degree n.

Quasi-symmetric functions

A formal power series $f(x_1, x_2, \dots)$ is quasi-symmetric if for every composition $(\alpha_1, \cdots, \alpha_k)$, all monomials $x_{i_1}^{\alpha_1} \cdots x_{i_k}^{\alpha_k}$ in f with indices $i_1 < i_2 < \cdots < i_k$ have the same coefficients.

Example

$$f = \sum_{i<j} x_i^2 x_j = x_1^2 x_2 + x_1^2 x_3 + x_2^2 x_3 + \dots$$

is quasi-symmetric but not symmetric.

Denote by $QSym$ the vector space of quasi-symmetric functions which are homogeneous of degree n.

The fundamental basis

For each subset $J \subseteq [n-1]$ define the corresponding fundamental quasi-symmetric function

$$F_J(\mathbf{x}) := \sum_{\substack{i_1 \le i_2 \le \ldots \le i_n \\ i_j < i_{j+1} \text{ if } j \in J}} x_{i_1} x_{i_2} \cdots x_{i_n}.$$

In particular, J can be the descent set of a permutation.

Example

$\pi = 132$, $\mathrm{Des}(\pi) = \{2\}$.

$$\mathcal{F}_{\mathrm{Des}(132)} = \mathcal{F}_{\{2\}} = x_1x_1x_2 + x_1x_1x_3 + x_1x_2x_3 + x_2x_2x_3 + \ldots.$$

Proposition (Gessel)

$\{F_J \mid J \subseteq [n-1]\}$ *is a basis for* $QSym_n$.

Schur-positivity

For $A \subseteq \mathcal{S}_n$, let

$$\mathcal{Q}(A) = \sum_{\pi \in A} \mathcal{F}_{Des(\pi)}.$$

$\mathcal{Q}(A)$ is called Schur-positive if it is symmetric and can be written as a linear combination of Schur functions with non-negative coefficients.

Question (Adin-Roichman, '13)

For which $A \subseteq \mathcal{S}_n$ is $\mathcal{Q}(A)$ (symmetric and) Schur-positive?

Schur-positivity

For $A \subseteq \mathcal{S}_n$, let

$$\mathcal{Q}(A) = \sum_{\pi \in A} \mathcal{F}_{Des(\pi)}.$$

$\mathcal{Q}(A)$ is called Schur-positive if it is symmetric and can be written as a linear combination of Schur functions with non-negative coefficients.

Question (Adin-Roichman, '13)

For which $A \subseteq \mathcal{S}_n$ is $\mathcal{Q}(A)$ (symmetric and) Schur-positive?

Main result 2: Schur-positivity of $Bl_{n,k}$

Recall

Definition

$$Bl_{n,k} := \{\pi \in \mathcal{S}_n(321) : \ \mathrm{bl}(\pi) = k\}.$$

Theorem (Adin-B.-Roichman '16)

$\mathcal{Q}(Bl_{n,k})$ is (symmetric and) Schur positive.

Main result 2: Schur-positivity of $Bl_{n,k}$

Recall

Definition

$$Bl_{n,k} := \{\pi \in \mathcal{S}_n(321) : \ \mathrm{bl}(\pi) = k\}.$$

Theorem (Adin-B.-Roichman '16)

$\mathcal{Q}(Bl_{n,k})$ is (symmetric and) Schur positive.

Main result 3: The character

Recall that the Frobenius image of an $\mathcal{S}_n$-character $\chi = \sum_{\lambda \vdash n} c_\lambda \chi^\lambda$ is the symmetric function $f = \sum_{\lambda \vdash n} c_\lambda s_\lambda$, denoted by $ch(\chi)$.

Theorem (Adin-B.-Roichman '16)

For every positive integer $1 \le k \le n-1$

$$\mathcal{Q}(Bl_{n,k}) = ch(\chi^{(n-1,n-k)} \downarrow_{\mathcal{S}_n}^{\mathcal{S}_{2n-k-1}})$$

and, for $k = n$,

$$\mathcal{Q}(Bl_{n,k}) = ch(\chi^{(n)}) = s_{(n)}.$$

Proof idea

Proof idea: bijection

The proofs use an explicit left-to-right-maxima preserving bijection from $Bl_{n,k}$ to $L_{n,n-k}$.

Definition

Define a map $f_n : \mathcal{S}_n(321) \mapsto \mathcal{S}_n(321)$, recursively on n, as follows. Each permutation $\pi \in S_n$ belongs to exactly one of the following 3 classes, distinguished according to the location of the letter n and the relative order of $n-1$ and n.

- L : n is the last letter.
- D: n is not the last letter, and $n-1$ precedes n.
- R: $n-1$ is to the right of n.

Proof idea: bijection

The proofs use an explicit left-to-right-maxima preserving bijection from $Bl_{n,k}$ to $L_{n,n-k}$.

Definition

Define a map $f_n : \mathcal{S}_n(321) \mapsto \mathcal{S}_n(321)$, recursively on n, as follows. Each permutation $\pi \in S_n$ belongs to exactly one of the following 3 classes, distinguished according to the location of the letter n and the relative order of $n-1$ and n.

- L : n is the last letter.
- D: n is not the last letter, and $n-1$ precedes n.
- R: $n-1$ is to the right of n.

Proof idea: bijection

Case L: n is the last letter.

- Omit n
- Apply f_{n-1};
- Insert n at the last position.

Case D: $n-1$ is left of n, but n is not the last letter.

- Omit n.
- Apply f_{n-1}.
- Multiply from left by the transposition $(n-k-1, n-k)$.
- Insert n at the same position as in π.

Case R: $n-1$ is right of n.
In this case $n-1$ must be the last letter.

- Exchange $n-1$ and n in π, then omit n.
- Apply f_{n-1}
- Multiply (from the left) the resulting permutation by the cycle $(n-k, n-k+1, ..., n-1, n)$.

Example

Let $\pi_8 = \pi = 31254786$.

$$\pi_8 = 312 \mid 54 \mid 786 \quad \xrightarrow[(45)]{D} \quad \pi_7 = 3125476 \xrightarrow[(4567)]{R} \pi_6 = 312 \mid 54 \mid 6$$

$$\xrightarrow{L} \quad \pi_5 = 312 \mid 54 \xrightarrow[(345)]{R} \pi_4 = 312 \mid 4$$

$$\xrightarrow{L} \quad \pi_3 = 312 \xrightarrow[(23)]{R} \pi_2 = 21$$

Example (cont.)

In the other direction:

$$
\begin{aligned}
f(\pi_2) = 21 \quad & \xrightarrow{(23)} \quad f(\pi_3) = 312 \to f(\pi_4) = 3124 \\
& \xrightarrow{(345)} \quad f(\pi_5) = 41253 \xrightarrow{(45)} f(\pi_6) = 412536 \\
& \xrightarrow{(4567)} \quad f(\pi_7) = 5126374 \xrightarrow{(45)} f(\pi_8) = 41263785
\end{aligned}
$$

Open problems

Open problems
